

# Pakistan Under Water

RED ALERT | N° 15

## Are these floods in Pakistan an 'act of God'?

A third of Pakistan's vast landmass was inundated by floods in the last week of August. Satellite imagery showed the rapid spread of the waters which broke the banks of the Indus River, covering large sections of two major provinces, Balochistan, and Sindh. On 30 August 2022, the United Nations Secretary-General António Guterres [called](#) it a 'monsoon on steroids', as the rainwaters [swept away](#) more than 1,000 people to their deaths and displaced about 33 million more. The situation is dire, with those who fled their homes in immediate and long-term danger. The people camped out on higher land, such as major roadways, are currently at risk of starvation and in danger of contracting water-borne diseases such as diarrhoea, dysentery, and hepatitis. In the long-term, people who have lost their standing crops (cotton and sugarcane) and livestock face guaranteed impoverishment. Pakistan's Planning Minister Ahsan Iqbal [estimates](#) that the damages will total more than \$10 billion.

At first glance, the primary reason for the floods appears to be additional heavy rain at the tail end of an already record-breaking monsoon or rainy season. A very hot summer with temperatures of over 40°C for long periods in April and May made Pakistan 'the hottest place on earth', [according to](#) Malik Amin Aslam, a former minister for

climate change. These scorching months resulted in abnormal melting of the country's northern glaciers, whose waters met the torrential rain spurred by a ['triple dip'](#) – three consecutive years of La Niña cooling in the equatorial Pacific Ocean. In addition, catastrophic climate change – driven by global carbon-fuelled capitalism – has also caused the glacial melt and downpour.

But the nature of the floods themselves are not wholly due to turbulent weather patterns. Significantly, the impact of the rising waters on Pakistan's population is due to unchecked deforestation and deteriorated infrastructure such as dams, canals, and other channels to contain water. In 2019, the World Bank [said](#) that Pakistan faces a 'green emergency' because each year about 27,000 hectares of natural forest is cut down, making rainwater absorption in the soil much more difficult.

Furthermore, lack of state investment in dams and canals (now heavily silted) has made it much harder to control large quantities of water. The most important of these dams, canals, and reservoirs are the [Sukkur Barrage](#), the world's largest irrigation system of its kind, which draws the Indus into the southern Sindh River, and the [Mangla and Tarbela reservoirs](#), which divert the waters from Pakistan's capital, Islamabad. Illegal real estate construction on floodplains further exacerbates the potential for human tragedy.

God has little to do with these floods. Nature has only compounded the underlying crises of capitalist-driven climate catastrophe and neglect of water, land, and forest management in Pakistan.

### What are the urgent multiple crises afflicting Pakistan?

The floodwaters have revealed a set of enduring problems that paralyse Pakistan. Surveys in May, before the floods, [showed](#) that 54%

of the population considered inflation to be their main problem. By August, the Pakistan Bureau of Statistics [reported](#) that the wholesale price index, which measures fluctuation in the average prices of goods, increased by 41.2% while the annual inflation rate was 27%. Despite inflation rising globally and the acknowledgment that the cost of the floods would be over \$10 billion, the International Monetary Fund (IMF) has [promised](#) a mere \$1.1 billion with austerity-like conditions attached to it such as 'prudent monetary policy'. It is criminal that the IMF would impose strict austerity when the country's agricultural infrastructure is utterly destroyed (this inadequate action is reminiscent of the British colonial policy to continue the export of wheat from India during the 1943 Bengal famine). The 2021 Global Hunger Index already [placed](#) Pakistan at 92 out of 116 countries with its hunger crisis – prior to the floods – at a serious level. Yet, as none of the country's bourgeois political parties have taken these findings to heart, undoubtedly, its economic crisis will intensify with little recovery.

This brings us to the acute political crisis. Since its independence from the British in 1947, 75 years ago, Pakistan has had 31 [prime ministers](#). In April 2022, the thirtieth, Imran Khan, was removed to install the current Prime Minister Shehbaz Sharif. Khan, who [faces](#) charges of terrorism and contempt of court, [alleged](#) that his government was removed at the behest of Washington owing to his close ties to Russia. Khan's Pakistan Tehreek-e-Insaf (PTI or 'Justice Party') did not win a majority in the 2018 elections, which left his coalition vulnerable to the departures of a handful of legislators. That is precisely what was done by the opposition, which stormed into power through legislative manoeuvres, without a new mandate from the public. Since his removal, the standing of Imran Khan and the PTI has risen in Pakistan, having won 15 out of 20 of July's by-elections in [Karachi](#) and [Punjab](#), before the floods. Now, as [anger](#)

rises against Sharif's government due to the slow pace of relief for flood victims, the political crisis will only deepen.

## What are the tasks at hand?

Pakistan is suffering from 'climate apartheid'. This country of over 230 million people [contributes](#) only 1% of global greenhouse gas emissions, yet it is [threatened](#) by the eighth highest climate risk in the world. The failure of Western capitalist countries to acknowledge their destruction of the planet's climate means that countries like Pakistan, which have low levels of emissions, are already disproportionately bearing the brunt of rapid climate change. Western capitalist countries [must](#) at least provide their full support to the Global Climate Action Agenda.

Left and progressive forces – such as the Mazdoor Kisan Party – and other civilian groups have organised a flood relief campaign in Pakistan's four provinces. They are reaching out mainly with food relief to tackle starvation in hard to reach, largely rural areas. The Pakistani Left is demanding that the government stem the tide of austerity and inflation that is sure to exacerbate the humanitarian crisis.
